

Ball Rail® Systems

Linear Motion and
Assembly Technologies

STAR – Ball Rail® Systems

Product Overview

STAR Ball Rail® Systems were specially developed for use in machine tools and industrial robots calling for compact, rolling-element linear motion guideways. Ball Rail® Systems are available in various accuracy classes, each with extremely high load capacity and high rigidity.

These compact assemblies are available in 8 common sizes and offer the same high load capacities in all four main load directions.

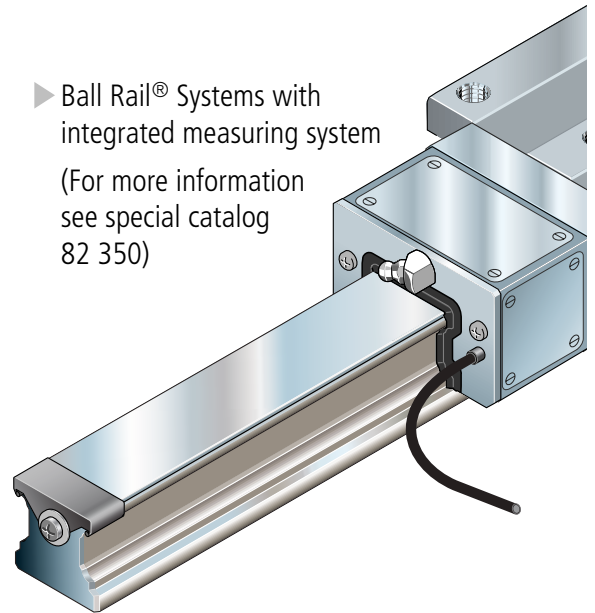

Make up your own compact linear motion guideways from interchangeable standard stock elements...

STAR manufactures its guide rails and runner blocks with such high precision, especially in the ball track zone, that each individual component element can be replaced by another at any time. This makes infinite combinations possible within each accuracy class.

Each element can be individually ordered and separately stocked.

Both sides of the guide rail can be used as reference edges.

- ▶ Ball Rail® Systems with integrated measuring system
(For more information see special catalog 82 350)

- ▶ For the majority of all applications:
STAR Runner Blocks, steel version

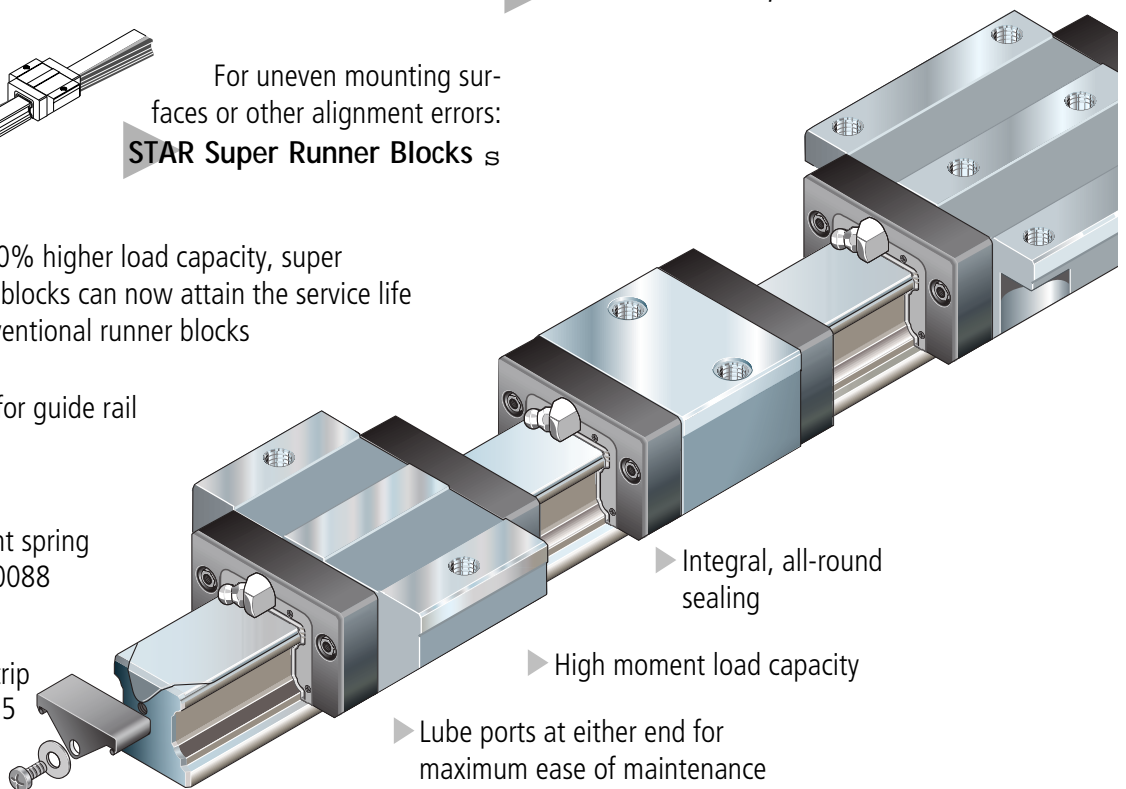

- ▶ For uneven mounting surfaces or other alignment errors:
STAR Super Runner Blocks s

- ▶ With 30% higher load capacity, super runner blocks can now attain the service life of conventional runner blocks

Proven Rail Seal® cover strip for guide rail mounting holes:

- ▶ One cover for all holes
- ▶ Material: corrosion resistant spring steel to DIN 17230 / EN 10088
- ▶ Easy clip-on mounting
- ▶ 0.3 mm Rail Seal® cover strip as standard for sizes 35 - 65

- ▶ Integral, all-round sealing
- ▶ High moment load capacity
- ▶ Lube ports at either end for maximum ease of maintenance
- ▶ One guide rail profile for all runner blocks

30% higher dynamic load capacities and moments as standard in all accuracy classes:

- extends service life by a factor of 2.2
- field-proven
- Equal load rating in all four main load directions

For lightweight applications:

STAR Runner Blocks, aluminum version

- ▶ Simline runner blocks for all configurations

For low-noise applications:

STAR Runner Blocks with spacer balls

- ▶ 4 different preload classes

- ▶ Mounting of flanged runner block from above or below

- ▶ Optimized entry-zone geometry and the high number of balls per track greatly reduce variations in elastic deflection

- ▶ Smooth, light running due to optimized ball recirculation and ideal track geometry

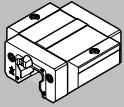

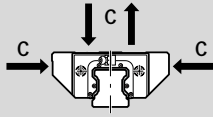

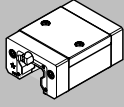

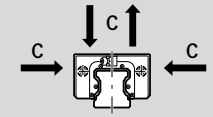

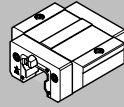

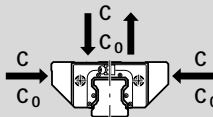

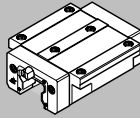

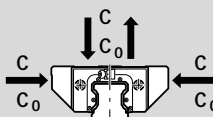

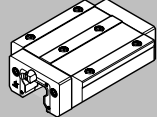

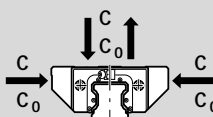

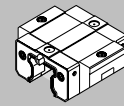

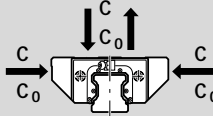

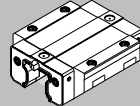

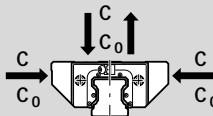

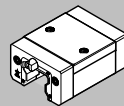

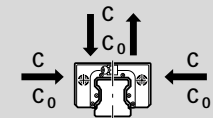

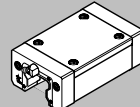

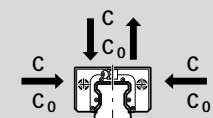

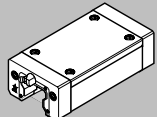

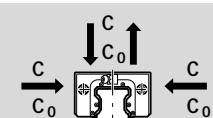

- ▶ End face mounting holes for attachment of bellows, lubrication plates or scraper plates

- ▶ Guide rail with mounting hole plugs

For high moment loads:
STAR Wide Ball Rail® Systems

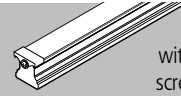

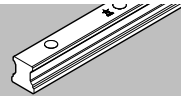

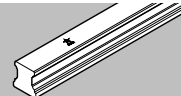

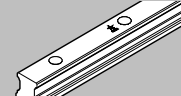

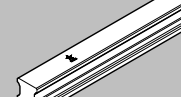

STAR – Ball Rail® Systems

Super Runner Blocks Σ Steel Version

Super Runner Block Σ
with self-aligning feature 1661-
Standard width, short

Special versions:

Runner blocks in accuracy class N
(clearance and preload 0.02 C) are
also available:

- with zinc-iron coating and yellow chromating
(part numbers 16...-4-30),
- with low friction seals
(part numbers 16...-4-11).

Part numbers

Size	Accuracy class	Part numbers for runner block for preload class	
		up to approx. 10 μ m clearance	Preload 0.02 C
15	H	1661-193-10	1661-113-10
	N	1661-194-10	1661-114-10
20	H	1661-893-10	1661-813-10
	N	1661-894-10	1661-814-10
25	H	1661-293-10	1661-213-10
	N	1661-294-10	1661-214-10
30	H	1661-793-10	1661-713-10
	N	1661-794-10	1661-714-10
35	H	1661-393-10	1661-313-10
	N	1661-394-10	1661-314-10

Permissible load

When calculating the service life, use the maximum load capacity figure.

The permissible load is only limited for statistical purposes (see table).

Note on dynamic load capacities and moments (see table)

Determination of dynamic load capacities and moments is based on a travel life of 100,000 m.

For comparison with the 50,000 m travel sometimes applied for rail-type guideways, the figures for **C** and **M_t** in the table should be multiplied by 1.26.

STAR – Ball Rail® Systems

Product Description Runner Blocks, Steel Version

These figures are also valid for the long versions.

The Ball Rail® System consists of:

- A guide rail with all surfaces ground and ball track zones hardened
- A runner block with all surfaces ground and ball track zones hardened, made of rolling bearing steel or with hardened and ground steel load bearing plates with
 - cage designed for optimum ball recirculation
 - integral all-round sealing of all ball tracks
 - bearing steel balls

Technical Data

Accuracy classes and their tolerances (µm)

STAR Ball Rail® Systems are offered in up to five different accuracy classes.

For available versions see table "Part Numbers".

Built-in interchangeability through precision machining

STAR manufactures its guide rails and runner blocks with such high precision, especially in the ball track zone, that each individual component element can be replaced by another at any time.

A runner block can be used without problems on various guide rails of the same size, for example.

This applies equally to the use of different runner blocks on one and the same guide rail.

Accuracy classes	Dimensional tolerances H and A ₃ (µm)		Max. difference in dimensions H and A ₃ on the same rail ΔH, ΔA ₃ (µm)
	H	A ₃	
UP	± 5	± 5	3
SP	± 10	± 7	5
P	± 20	± 10	7
H	± 40	± 20	15
N	± 100	± 40	30

STAR – Ball Rail® Systems Mounting Instructions

For guide rails with runner block
1621-, 1622-, 1623-, 1624-, 1651-, 1653-, 1694-

Reference edges, corner radii,
mounting screw sizes and
tightening torque

Runner block 1651-, 1653-

- Standard width

Guide rails

left:

- For mounting from above 1605-, 1645-

right:

- For mounting from below 1607-, 1647

Runner block 1621-, 1622-, 1623-, 1624-, 1694-

- Slimline

Guide rail

- For mounting from above 1605-, 1645-

Note

The indicated combinations represent examples. It is on principle possible to combine any runner block with all the offered guide rail types.

Dimensions and recommended limits for side load if no additional lateral retention is provided

- When mounting the runner block from above using only 4 O₄ screws:
 - Permissible side force 1/3 lower
 - Lower rigidity

- For runner block mounting with 6 screws:
 - Tighten the centerline screws with the torque for strength class 8.8

- When mounting with 2 O₂ screws and 4 O₁ screws

- Runner block 1621-, 1622-, 1651-, 1694-
- Runner block 1623-, 1624-, 1653-

Locating pins

If the recommended values for permissible side forces are exceeded (see table), the runner block must be additionally fixed by means of locating pins or reference edges.

Recommended dimensions for the pin holes are indicated in the drawings and table.

Possible pin types

- Taper pin (hardened) or
- Straight pin DIN 6325

Note

Ready-drilled holes made for production reasons may exist at the recommended pin hole positions ($\varnothing < S_{10}$).

These may be extended and bored open to accommodate the locating pins.

If the locating pins have to be driven in at another point (e.g. when the lube port is central), dimension E_2 must not be exceeded in the longitudinal direction (for dimension E_2 , see the tables for the individual types).

Observe dimensions E_1 and E_4 !

Only prepare the pin holes after the installation is complete (see also "General Mounting Instructions").

Standard width 1651-, 1653-

STAR – Ball Rail® Systems

Mounting Instructions – Runner Blocks, Steel Version

Parallelism offset of the rails after mounting

measured at the guide rails and at the runner blocks

The values for parallelism offset P_1 apply to all runner blocks of the standard range. Values around 20% higher are permissible for the runner block 1665- (standard width, short) and 1666- (slimline, short).

Note

The parallelism offset P_1 causes a slight increase in preload on one side of the assembly.

If the tolerances given in the table are not exceeded, reduction in travel life will as a rule be negligible.

The given values apply to precision mounting. For standard mounting, double the stated values can be used.

Size	Parallelism offset P_1 (mm)			
	up to approx. 10 μm clearance	Preload 0.02 C	Preload 0.08 C	Preload 0.13 C
15	0.015	0.009	0.005	0.004
20	0.018	0.011	0.006	0.004
25	0.019	0.012	0.007	0.005
30	0.021	0.014	0.009	0.006
35	0.023	0.015	0.010	0.007
45	0.028	0.019	0.012	0.009
55	0.035	0.025	0.016	0.011
65	0.048	0.035	0.022	0.016

Vertical offset

The vertical offset values apply to all runner blocks of the standard program.

Values around 20% higher are permissible for the runner block 1665- (standard width, short) and 1666- (slimline, short).

If the admissible vertical offset S_1 and S_2 is not exceeded, reduction in travel life will as a rule be negligible.

Permissible vertical offset in the transverse direction

The permissible vertical offset S_1 includes the tolerance for dimension H in accordance with the table given in the "Technical Data" section.

$$S_1 = a \cdot Y$$

S_1 = permissible vertical offset (mm)
 a = distance between rails (mm)
 Y = calculation factor

Calculation factor	for preload class			
	up to approx. 10 μm clearance	Preload 0.02 C	Preload 0.08 C	Preload 0.13 C
Y	$4.3 \cdot 10^{-4}$	$2.8 \cdot 10^{-4}$	$1.7 \cdot 10^{-4}$	$1.2 \cdot 10^{-4}$

Permissible vertical offset in the longitudinal direction

The permissible vertical offset S_2 includes the tolerance "Max. difference in dimension H on the same rail" in accordance with the table given in the "Technical Data" section.

Values around 40% higher are permissible for the runner block 1665- (standard width, short) and 1666- (slimline, short).

Values around 30% lower are permissible for runner block 1653- (standard width long), 1623- (slimline, long) and 1624- (slimline, high, long).

$$S_2 = b \cdot 4.3 \cdot 10^{-5}$$

S_2 = permissible vertical offset (mm)
 b = distance between runner blocks (mm)

30% higher dynamic load capacities and moments

STAR – Ball Rail® Systems

Runner Blocks, Steel Version

Runner block 1663-

Standard width, short, low profile

Special versions:

Runner blocks in accuracy class N (clearance and preload 0.02 C) are also available:

- with zinc-iron coating and yellow chromating (part numbers 16...4-30),
- with low friction seals (part numbers 16...4-11).

Part numbers

Size	Accuracy class	Part numbers for runner blocks for preload class	
		up to approx. 10 µm clearance	Preload 0.02 C
20	H	1663-893-10	1663-813-10
	N	1663-894-10	1663-814-10

Note on dynamic load capacities and moments (see table)

Determination of dynamic load capacities and moments is based on a travel life of 100,000 m.

For comparison with the 50,000 m travel sometimes applied for rail-type guideways, the figures for C , M_t and M_L in the table should be multiplied by 1.26.

30% higher dynamic load capacities and moments

STAR – Ball Rail® Systems

Product Overview – Runner Blocks, Aluminum Version

STAR Ball Rail® Systems with aluminum runner blocks were specifically developed for use in industrial robots and general purpose machines calling for compact, rolling-element linear motion guideways and are available in different accuracy classes, each with high load capacity and high rigidity.

These compact and weight-saving assemblies are available in 6 common sizes and offer the same high dynamic load capacities in all four main load directions.

Make up your own compact linear motion guideways from interchangeable standard stock elements...

STAR manufactures its guide rails and runner blocks with such high precision, especially in the ball track zone, that each individual component element can be replaced by another at any time. This makes infinite combinations possible within each accuracy class.

Each element can be individually ordered and separately stocked.

Both sides of the guide rail can be used as reference edges.

The runner block is simply pushed onto the rail.

▶ Lube ports possible at either end for added ease of maintenance

▶ Very low weight: 60% lighter than the equivalent steel version

▶ Greater permissible parallelism offset as well as greater permissible vertical and horizontal offset of mounting surfaces

▶ Guide rails in accuracy class N also available with surface protection

▶ End face mounting holes for attachment of bellows or scraper plates

▶ Accuracy classes H and N can be combined with any of the rails in each accuracy class

▶ For mounting from above or below

30% higher dynamic load capacities and moments than previous design.

- extends service life by a factor of 2.2
- field-proven
- identical in all four main load directions

- ▶ Pre-drilled locating pin holes in runner blocks
- ▶ Mounting of attachments to runner block from above or below
- ▶ High moment load capacity
- ▶ Two holes at the centre of the runner block permit insertion of additional mounting screws for improved rigidity under lift-off and side loading conditions
- ▶ Optimized entry-zone geometry and the high number of balls per track greatly reduce variations in elastic deflection
- ▶ Smooth, light running due to optimized ball recirculation and ideal track geometry

Proven Rail Seal® cover strip for guide rail mounting holes:

- ▶ One cover for all holes
- ▶ Material: corrosion resistant spring steel to DIN 17230 / EN 10088
- ▶ Easy clip-on mounting

STAR – Ball Rail® Systems

Product Description – Runner Blocks, Aluminum Version

Standard width

Slimline

The Ball Rail® System consists of:

- A guide rail with all surfaces ground and ball track zones hardened
- A high-strength aluminum alloy runner block with
 - hardened and ground steel load bearing plates with ball tracks
 - cage designed for optimum ball recirculation
 - integral all-round sealing of all tracks
 - bearing steel balls

Technical Data – Runner Blocks, Aluminum Version

Accuracy classes and their tolerances (µm)

STAR Ball Rail® Systems with runner blocks in aluminum are offered in two different accuracy classes.

However, these can be combined with guide rails of all accuracy classes.

Built-in interchangeability through precision machining

STAR manufactures its guide rails and runner blocks with such high precision, especially in the ball track zone, that each individual component element can be replaced by another at any time.

A runner block can be used without problems on various guide rails of the same size, for example.

This applies equally to the use of different runner blocks on one and the same guide rail.

Accuracy classes	Dimensional tolerances H and A ₃ (µm)		Max difference in dimensions H and A ₃ on the same rail ΔH, ΔA ₃ (µm)
	H	A ₃	
H	± 40	± 20	15
N	± 100	± 40	30

Measured at middle of runner block:		For any runner block/rail combination at any position on rail
		For different runner blocks at same position on rail

Parallelism offset P₁ of the Ball Rail System in service

Measured at middle of runner block

STAR – Ball Rail® Systems

Mounting Instructions – Aluminum Runner Blocks

Locating pins

If the recommended values for permissible side forces are exceeded, the runner block must be additionally fixed by means of locating pins or reference edges.

Possible pin types

- Taper pin (hardened) or
- Straight pin DIN 6325

Note

Runner block Standard width 1631-:
Pin holes already drilled as illustrated

Runner block Slimline 1632-:

Recommended dimensions for the pin holes are indicated in the drawings and table.

For both types of runner blocks:

If the locating pins have to be driven in at another point (e.g. when the lube port is central), dimension E_2 must not be exceeded in the longitudinal direction (for dimension E_2 , see the tables for the individual types).

Observe dimensions E_1 and E_4 !

Only prepare the pin holes after the installation is complete (see also "General Mounting Instructions").

Size	Taper pin (hardened) Straight pin (DIN 6325)		Dimensions (mm)		
	S_{10}	L_{10}	E_1	E_4	N_9 (max)
15	4	18	26	38	6.0
25	6	32	35	55	9.0
30	8	36	40	70	12.0
35	8	40	50	80	13.0

Parallelism of the rails after mounting

measured at the guide rails and at the runner blocks

The parallelism offset P_1 causes a slight increase in preload on one side of the assembly. If the tolerances given in the table are not exceeded, reduction in travel life will as a rule be negligible.

The given values apply to precision mounting. For standard mounting, double the stated values can be used.

Size	Parallelism offset P_1 (mm)	
	up to approx. 10 μm clearance	Preload 0.02 C
15	0.021	0.014
25	0.026	0.017
30	0.029	0.019
35	0.035	0.022

Vertical offset

Provided the permissible vertical offset S_1 and S_2 is not exceeded, any resultant reduction in travel life will as a rule be negligible.

Permissible vertical offset in the transverse direction

The permissible vertical offset S_1 includes the tolerance for dimension H in accordance with the table given in the "Technical Data" section.

$S_1 = a \cdot Y$	S_1 = Permissible vertical offset (mm) a = Distance between rails (mm) Y = Calculation factor
-------------------	---

Calculation factor	for preload class	
	up to approx. 10 μm clearance	Preload 0.02 C
Y	$7 \cdot 10^{-4}$	$5 \cdot 10^{-4}$

Permissible vertical offset in the longitudinal direction

The permissible vertical offset S_2 takes into account the tolerance for the "max. difference in dimensions H on the same rail" according to the table given in the "Technical Data" section.

$S_2 = b \cdot 6 \cdot 10^{-5}$	S_2 = Permissible vertical offset (mm) b = Distance between runner blocks (mm)
---------------------------------	---

STAR – Ball Rail® Systems

Runner Blocks, Aluminum Version

Runner block 1631- Standard width

Special versions:

Runner blocks in accuracy class N (clearance and preload 0.02 C) are available:

- with low-friction seals (Part numbers 16...4-11).

Part numbers

Sizes 45 and 55 available as special versions.

Size	Accuracy class	Part numbers for runner blocks for preload class	
		up to approx. 10 µm clearance	Preload 0.02 C
15	H	1631-193-10	1631-113-10
	N	1631-194-10	1631-114-10
25	H	1631-293-10	1631-213-10
	N	1631-294-10	1631-214-10
30	H	1631-793-10	1631-713-10
	N	1631-794-10	1631-714-10
35	H	1631-393-10	1631-313-10
	N	1631-394-10	1631-314-10

Permissible load

When calculating the service life, use the maximum load capacity figure.

The permissible load is only limited for statistical purposes (see table).

Note on dynamic load capacities and moments (see table)

Determination of dynamic load capacities and moments is based on a travel life of 100,000 m.

For comparison with the 50,000 m travel sometimes applied for rail-type guideways, the figures for C , M_t and M_l in the table should be multiplied by 1.26.

Ordering a guide rail

Ordering example 1:

Guide rail size 35/90,
accuracy class H,
rail length 1756 mm,
(21 · T, number of holes n_B = 22
giving 44 holes in 2 rows)
Ordering data: **1675-303-31, 1756 mm**

Intermediate lengths

Calculation of rail length L and ordering examples:

- The preferred dimension is T₁₅
- If T₁₅ cannot be used, then
 - Select an end space T₁ between T₁₅ and T_{1min}
 - Do not go below the minimum spacing T_{1min}!

Note

- T₁, T_{1min}, T₁₅ are the same at either end of the rail.

$$L = n_B \cdot T - 4$$

or

$$L = n_T \cdot T + 2 \cdot T_{15}$$

L = rail length (mm)

T = hole spacing*) (mm)

T₁₅ = preferred dimension*) (mm)

n_B = number of holes per row

n_T = number of spaces

*) see table for values

Ordering example 2 (up to L_{max}):

Guide rail size 35/90,
accuracy class P,
rail length 1676 mm,
(20 · T, preferred dimension T₁₅ = 38 mm;
number of holes n_B = 21 giving 42 holes
in 2 rows)

Ordering data:

Part number, length (mm)
T₁₅ / n_T · T / T₁₅ (mm)
1675-302-31, 1676 mm
38 / 20 · 80 / 38 mm

Rail lengths above L_{max} are made up of fitted rail sections mounted end to end.

Ordering example 3 (over L_{max}):

Guide rail size 35/90,
accuracy class P,
rail length 5036 mm, 2 sections
(62 · T, preferred dimension T₁₅ = 38 mm;
number of holes n_B = 63 giving 126 holes
in 2 rows)

Ordering data:

Part number and number of sections,
length (mm)
T₁₅ / n_T · T / T₁₅ (mm)
1675-302-32, 5036 mm
38 / 62 · 80 / 38 mm

35/90	P	1677-302-31,....	1677-302-3,....	
	H	1677-303-31,....	1677-303-3,....	
	N	1677-304-31,....	1677-304-3,....	

Dimensions and masses

Size	Dimensions (mm)									Mass kg/m
	A ₂	H ₂	N ₇	S ₇	T ₁₅ ^{±0.5}	T _{1min}	T	T ₃	L _{max}	
20/40	42	19.05	7.5	M5	28	10	60	24	4 000	5.3
25/70	69	23.40	12.0	M6	38	10	80	40	4 000	11.6
35/90	90	32.00	15.0	M8	38	12	80	60	4 000	21.0

Ordering a guide rail

Ordering example 1:

Guide rail size 35/90,
accuracy class H,
rail length 1756 mm,
(21 · T, number of holes n_B = 22
giving 44 holes in 2 rows)
Ordering data: **1677-303-31, 1756 mm**

Intermediate lengths

Calculation of rail length L and ordering examples:

- The preferred dimension is T₁₅
- If T₁₅ cannot be used, then
 - Select an end space T₁ between T₁₅ and T_{1min}
 - Do not go below the minimum spacing T_{1min}!

Note

- T₁, T_{1min}, T₁₅ are the same at either end of the rail.

$L = n_B \cdot T - 4$ <p>OR</p> $L = n_T \cdot T + 2 \cdot T_{15}$	L = rail length (mm) T = hole spacing*) (mm) T ₁₅ = preferred dimension*) (mm) n _B = number of holes per row n _T = number of spaces *) see table for values
--	---

Ordering example 2 (up to L_{max}):

Guide rail size 35/90,
accuracy class P,
rail length 1676 mm,
(20 · T, preferred dimension T₁₅ = 38 mm;
number of holes n_B = 21 giving 42 holes
in 2 rows)

Ordering data:

Part number, length (mm)
T₁₅ / n_T · T / T₁₅ (mm)
1677-302-31, 1676 mm
38 / 20 · 80 / 38 mm

Rail lengths above L_{max} are made up of fitted rail sections mounted end to end.

Ordering example 3 (over L_{max}):

Guide rail size 35/90,
accuracy class P,
rail length 5036 mm, 2 sections
(62 · T, preferred dimension T₁₅ = 38 mm;
number of holes n_B = 63
giving 126 holes in 2 rows)

Ordering data:

Part number and number of sections,
length (mm)
T₁₅ / n_T · T / T₁₅ (mm)
1677-302-32, 5036 mm
38 / 62 · 80 / 38 mm

STAR – Ball Rail® Systems

Accessories, Standard Ball Rail® Systems

Lubrication plate

– Material: aluminum

Versions:

- Standard (for standard lube nipple)
- G 1/8 connection

Mounting:

The parts required for mounting on the runner block are supplied along with the optional attachments.

Size 25 - 65:

The runner block lube nipple can be used.

Size 15 and 20:

A funnel-type lube nipple with a knock-in spigot is supplied ready for insertion.

For mounting details, see "Mounting Instructions for Ball Rail® Systems".

Standard lubrication plate

Scraper plate

- Material: corrosion resistant spring steel to DIN 17230 / EN 10088
- Finish: bright

Mounting:

The mounting screws are supplied with the scraper plate.

When mounting, ensure that there is a uniform gap between runner block and scraper plate.

Scraper plates for guide rails with Rail Seal® cover strips.

STAR – Ball Rail® Systems

Accessories, Standard Ball Rail® Systems

Protective bellows

- Material: Bellows-type protective cover of polyurethane-coated polyester fabric
 - Aluminum lubrication plates
- The runner block lube nipple can be used.

Heat resistant bellows

- Material: Nomex fabric, metallized on both sides.
- Non combustible, non flammable
- Resistant to sparks, welding splashes and hot chips
- Temperature resistance:
Temperatures of up to 200°C near the protective metal coat possible.
Operating temperature for the entire bellows: 100°C.

Available in sizes 25-55.

The runner block lube nipple can be used.

Mounting instructions

The bellows are delivered preassembled ready for installation, complete with the screws required for attachment to the guide rail.

In types 1 and 2, thread size M4 10 mm deep and countersunk 2 x 45° must be tapped in each end face of the rail.

Size 25 - 65:

The runner block lube nipple can be used.

Size 15 and 20:

A funnel-type lube nipple with knock-in spigot is supplied.

For mounting details, see "Mounting Instructions for Lubrication Plates and Bellows".

STAR – Ball Rail® Systems Maintenance and Lubrication

Maintenance

Dirt can settle and encrust on guide rails, especially when these are not enclosed. To ensure that seals and Rail Seal® cover strips will retain their functionality, this dirt must be removed at regular intervals.

It is advisable to run the machine through a full "cleaning cycle" over the entire installed rail length at least twice a day, but no later than the end of every 8-hour shift. Always run a cleaning cycle before shutting down the machine.

Lubrication

Star Ball Rail® Systems are delivered filled with an anti-corrosion agent. Either oil or grease can be used as a lubricant.

Before start-up, make sure the system has sufficient initial lubrication.

Grease Lubricants

We recommend a grease lubricant to DIN 51825:

- K2K
 - For higher loads:
 - KP2K
Consistency class NLGI 2 to DIN 51818
- Observe the manufacturer's instructions.

Short stroke.

Stroke < 2 runner block lengths:

- Provide 2 lube ports per runner block and lubricate these!

Stroke < 0.5 runner block length:

- Provide 2 lube ports per runner block and lubricate these!
- Move the runner block 2x runner block length per lubricating cycle. If this is not possible, please consult Star.

Lubricant quantities as per Table 1.

Apply the specified lubricant quantity per lube port.

Size	Grease lubricants	
	Initial lubrication partial quantity (cm ³)	In-service lubrication (cm ³)
15	0.4 (x 3)	0.4
20	0.7 (x 3)	0.7
25	1.4 (x 3)	1.4
30	2.2 (x 3)	2.2
35	2.2 (x 3)	2.2
45	4.7 (x 3)	4.7
55	9.4 (x 3)	9.4
65	15.4 (x 3)	15.4
20/40	1.0 (x 3)	1.0
25/70	1.4 (x 3)	1.4
35/90	2.7 (x 3)	2.7

Table 1

Size	In-service lubrication intervals under normal operating conditions
	Travel (km)
	Load ≤ 0,15 C
15	1000
20	1000
25	1000
30	1000
35	500
45	250
55	150
65	100

Table 2

Size	Oil Lubrication Initial and in-service lubrication (cm ³)
15	0.4
20	0.7
25	0.8
30	1.1
35	1.2
45	2.2
55	3.6
65	6.0
20/40	0.7
25/70	1.1
35/90	1.8

Table 3

Always lubricate runner blocks before start up (initial lubrication)

Initial lubrication requires a total of three times the partial quantity given in Table 1:

1. Apply the first partial quantity of lubricant as per Table 1 to runner block.
2. Slide runner blocks back and forth over at least three times the block length for three full cycles.
3. Repeat steps 1. and 2. twice more
4. Check whether a film of lubricant is visible on the guide rail.

In-service lubrication of runner blocks

- Once the in-service lubrication interval as given in Table 2 is reached, apply the lubricant quantity as stated in Table 1. If the equipment is to operate in an environment subject to dirt or vibration and shock loads, etc., we recommend shortening the in-service lubrication interval.

The smaller the load, the longer the intervals between in-service lubrication will be.

Oil lubricants

 Add the entire oil quantity at one time!

Lubrication interval ≤ 40000 m

One-point oil lubrication

Notes

Recommended interval between two pulses: 10 seconds.

Example for size 45:

4 pulses of 0.6 cm³ each in 50 seconds.

The quantities listed in the table are valid for:

$F \leq 0.3 C$

$v \leq 1 \text{ m/s}$

Lubrication interval $\leq 40,000 \text{ m}$

If the equipment is to operate in an environment subject to dirt or vibration and shock loads, etc., we recommend shortening the in-service lubrication interval.

Size	Lubricant quantities for one-point oil lubrication	
	Oil lubricant quantity / pulse (cm ³)	Pulses per lube cycle
15	0.6	1
20	0.6	2
25	0.6	2
30	0.6	2
35	0.6	2
45	0.6	4
55	1.5	3
65	1.5	4
20/40	0.6	2
25/70	0.6	2
35/90	0.6	3

Table 4

Stroke > 2 runner block lengths:

– Provide 1 lube port per runner block.

Oil lubricant to ISO VG 220.

Lubricant quantities to Table 4.

Stroke < 2 runner block lengths:

- Provide 2 lube ports per runner block.

Oil lubricant to ISO VG 220.

Lubricant quantities to Table 4.

Apply the specified lubricant quantity per lube port.

Installation at an angle about the centerline

Stroke < 2 runner block lengths:

– Provide 2 lube ports per runner block.

Add the lubricant quantity as specified in Table 4 in one pulse.

If this is not possible, please consult STAR.

Special Lube Ports

Lube ports mounted on the top (1) or on the sides (2) are available on request.

STAR – Ball Rail® Systems Front Lube Unit

Advantages during mounting and in service:

- Up to 10,000 km travel
- Only initial lubrication of the runner block necessary
- Front Lube Units at both runner block ends
- Minimal lubricant loss
- Reduced oil consumption
- No lubrication lines
- Max. operating temperature 60C°

▶ Ports provided at end and side for convenient refilling using lube nipple

▶ Lube port on end face also suitable for lubricating runner block with grease

Size	Travel under normal operating conditions Travel (km)
	Load ≤ 0,15 C
15	10000
20	10000
25	10000
30	10000
35	4000
45	2500
55	1500
65	1000

STAR – Ball Rail® Systems

Runner block with two front lubrication units

Oil consumption comparison (Ball Rail® System size 25)

Front lubrication units	Lubricant quantity per lubrication cycle (cm ³)	Travel (m)	Consumption (cm ³ /km)
without	1.2	20 000	0.06 ! 100 %
with	5.2	5 000 000	0.00104 ! 1.73 %

Specially designed oil distribution channels ensure that lubricant is applied only where needed: directly to the ball tracks and the guide rail surfaces (2).

Front Lube Units for Ball Rail® Systems

- Material: special plastic.

Mounting instructions:

Comes complete with coated mounting screws and lubricating nipple.

Front Lube Units with the part numbers stated below: ...-00 are supplied ready-filled with oil and can be mounted immediately.

*Also available with dry reservoir for special lubricants.

Part numbers, dimensions.

Size	Part numbers	Dimensions (mm)										Oil (cm ³)
		A ₄	B ₅	H	H ₃	H ₄	N ₈	N ₉	S ₈	S ₉
